Heat A1 up to a temperature of 75° C +/- 2°C. Add A2 to A1 and mix until a clear solution is obtained. Disperse A4 in A3 and add it to the hot watery phase, stirring until a clear and slightly viscous gel is obtained. Heat the ingredients of phase B up to a temperature of 72° C +/- 2°C, mixing until all solids are melt. Add phase A to phase B stirring and homogenizing.

Cool down the product mixing: go on with the addition of other ingredients only when the temperature of the emulsion is 40°C or less.

While the product is cooling down, prepare phase C and phase D. Heat water (C1) to a temperature of 40°C. Add C2 to water and keep stirring until complete solubilization.

Add D1 to D2 and mix until a viscous clear gel is formed.

When the temperature of the product is below 40°C, phase C, phase D and ingredients F, G, H one by one mixing and homogenizing after every addition.

Cool down the product to room temperature. Add perfume and preservatives and adjust the pH to the requested value. Add STABILIZER/THICKENER as needed to get the desired viscosity.
