Heat all of the ingredients of phase A to a temperature of 72°C +/- 2° C mixing.

Disperse B3 in B2. Add the dispersion to B1, stirring and homogenizing until a clear, fluid gel is obtained.

Add B4 to the gel, stirring and turbo-mixing until homogeneous.

Heat phase B to a temperature of 75° +/- 2°C

When the indicated temperatures have been reached, add phase B to phase A while stirring and homogenizing.

After the union, continue to stir and homogenize for about 10 minutes.

Cool

the product to a temperature of 40°C, then add phases from C to H in the given order, stirring and homogenising after every addition. Heat water (I2) to a temperature of 35±2°C. Add I1 to stirring water, stir until complete solubilization and add the solution to the emulsion, mixing and stirring. Add preservatives, parfum and pH regulator as much as needed to set the pH between 6,00 and 6,50. Stop homogenizing and continue stirring until the emulsion reaches room temperature.
